**ABSTRACT**

A tracking device for tracking the number of times a garment has been worn. The device comprises an elongated body, a plurality of manually frangible elements on the elongated body, and adhesive on the elongated body, for adhering to the garment. Each of the frangible elements may comprise a bubble which flattens when burst. The frangible elements are linearly arrayed in a single row along the body. The body is vacuum formed from a synthetic resin and is die cut. The tracking device may be commercially provided as an assembly of separable tracking devices secured parallel to other tracking devices, with a frangible seam separating each two adjacent tracking devices.
